09 fields between your product and ChatGPT.

OpenAI's shopping feed requires all nine. Leave one empty and the row is rejected.

THE PRODUCT, 01 TO 05

What it is.

01 **ID**

One code for this exact variant. Never reused.

02 **Title**

Brand, model, colour, size. The precise product.

03 **Description**

What it is, in plain text. Not text baked into an image.

04 **Link**

The product page, opened on this variant.

05 **Brand**

The brand name, as it appears on the page.

THE OFFER, 06 TO 09

What's for sale.

06 **Seller**

Your store's name, as the buyer should read it.

07 **Image**

A photo of this variant, as a direct link.

08 **Availability**

In stock, out of stock, or unknown. Never blank.

09 **Price**

The amount and the currency, like 399.00 USD.

Nine fields. One gap, and the row is rejected.

WHERE RECORDS BREAK

One empty field.

No brand. The agent sees a headphone and can't tell Sony from a lookalike, so it won't match the request.

05
BRAND

WHAT HAPPENS NEXT

Rejected.

Leave one of the nine empty and OpenAI's feed rejects the row. The agent never sees that product.

YOUR TURN

Which field is empty in your catalog?

Start with title, brand and price. That's where most catalogs go quiet.
